

### **Association Rule Mining**

Given a set of transactions, find rules that will predict the occurrence of an item based on the occurrences of other items in the transaction

#### **Market-Basket transactions**

| TID | Items                     |
|-----|---------------------------|
| 1   | Bread, Milk               |
| 2   | Bread, Diaper, Beer, Eggs |
| 3   | Milk, Diaper, Beer, Coke  |
| 4   | Bread, Milk, Diaper, Beer |
| 5   | Bread, Milk, Diaper, Coke |

### **Example of Association Rules**

```
{Diaper} → {Beer},
{ Bread} → {Milk},
{ Bread, Milk} → {Diaper}
```

Implication here means co-occurrence, not causality!

#### **Definition: Frequent Itemset**

#### **Itemset**

- A collection of one or more items
   Example: {Milk, Bread, Diaper}
- k-itemset
   An itemset that contains k items

#### **Support count (σ)**

- Frequency of occurrence of an itemset
- E.g.  $\sigma(\{Bread, Milk, Diaper\}) = 2$

#### **Support**

- Fraction of transactions that contain an itemset
- E.g. s({Milk, Bread, Diaper}) = 2/5

#### **Frequent Itemset**

 An itemset whose support is greater than or equal to a minsup threshold

| TID | Items                     |
|-----|---------------------------|
| 1   | Bread, Milk               |
| 2   | Bread, Diaper, Beer, Eggs |
| 3   | Milk, Diaper, Beer, Coke  |
| 4   | Bread, Milk, Diaper, Beer |
| 5   | Bread, Milk, Diaper, Coke |

# Definition: Association Rule

#### **Association Rule**

- An implication expression of the form X → Y,
   where X and Y are itemsets
- Example: {Milk, Diaper} → {Beer}

| TID | Items                     |
|-----|---------------------------|
| 1   | Bread, Milk               |
| 2   | Bread, Diaper, Beer, Eggs |
| 3   | Milk, Diaper, Beer, Coke  |
| 4   | Milk, Diaper, Beer, Bread |
| 5   | Milk, Diaper, Bread, Coke |

#### **Rule Evaluation Metrics**

- Support (s)
   Fraction of transactions that contain both X and Y
- Confidence (c)
   Measures how often items in Y appear in transactions that contain X

#### Example:

$$\{Milk, Diaper\} \Rightarrow Beer$$

$$s = \frac{\sigma(\text{Milk, Diaper, Beer})}{|T|} = \frac{2}{5} = 0.4$$

$$c = \frac{\sigma(\text{Milk, Diaper, Beer})}{\sigma(\text{Milk, Diaper})} = \frac{2}{3} = 0.67$$

### **Association Rule Mining Task**

Given a set of transactions T, the goal of association rule mining is to find all rules having

- support ≥ minsup threshold
- confidence ≥ minconf threshold

#### **Brute-force approach:**

- List all possible association rules
- Compute the support and confidence for each rule
- Prune rules that fail the minsup and minconf thresholds
- ⇒ Computationally prohibitive!

# **Mining Association Rules**

| TID | Items                     |
|-----|---------------------------|
| 1   | Bread, Milk               |
| 2   | Bread, Diaper, Beer, Eggs |
| 3   | Milk, Diaper, Beer, Coke  |
| 4   | Bread, Milk, Diaper, Beer |
| 5   | Bread, Milk, Diaper, Coke |

# Example of Rules:

```
{Milk, Diaper} \rightarrow {Beer} (s=2/5, c=2/3) 
{Milk, Beer} \rightarrow {Diaper} (s=2/5, c=2/2) 
{Diaper, Beer} \rightarrow {Milk} (s=2/5, c=2/3) 
{Beer} \rightarrow {Milk, Diaper} (s=2/5, c=2/3) 
{Diaper} \rightarrow {Milk, Beer} (s=2/5, c=2/4) 
{Milk} \rightarrow {Diaper, Beer} (s=2/5, c=2/4)
```

#### **Observations:**

- All the above rules are binary partitions of the same itemset: {Milk, Diaper, Beer}
- Rules originating from the same itemset have identical support but can have different confidence
- Thus, we may decouple the support and confidence requirements

### **Mining Association Rules**

#### Two-step approach:

- Frequent Itemset Generation
   Generate all itemsets whose support ≥ minsup
- 2. Rule Generation

Generate high confidence rules from each frequent itemset, where each rule is a binary partitioning of a frequent itemset

Frequent itemset generation is still computationally expensive

### **Frequent Itemset Generation**

### **Frequent Itemset Generation**

#### **Brute-force approach:**

- Each itemset in the lattice is a candidate frequent itemset
- Count the support of each candidate by scanning the database

# **Computational Complexity**

#### Given d unique items:

Total number of itemsets = 2<sup>d</sup>

Total number of possible association rules:

6 × 10⁴ 5 Number of rules 9 10 d

#ways left side items can be chosen out of d items

#ways right side items can be chosen using the remaining d-k

$$R = \sum_{k=1}^{d-1} \left[ \binom{d}{k} \times \sum_{j=1}^{d-k} \binom{d-k}{j} \right]$$

$$= 3^{d} - 2^{d+1} + 1$$

If d=6, R = 602 rules

An example d= 3 and item set = {abc}  

$$\{a\} \rightarrow \{b\} \ \{a\} \rightarrow \{c\} \ \{a\} \rightarrow \{bc\} \}$$
  
 $\{b\} \rightarrow \{a\} \ \{b\} \rightarrow \{c\} \ \{b\} \rightarrow \{ac\} \}$   
 $\{c\} \rightarrow \{a\} \ \{c\} \rightarrow \{b\} \ \{c\} \rightarrow \{ab\} \}$   
 $\{ab\} \rightarrow \{c\} \ \{ac\} \rightarrow \{b\} \ \{bc\} \rightarrow \{a\} \}$ 

### Frequent Itemset Generation Strategies

#### Reduce the number of candidates (M)

- Complete search: M=2<sup>d</sup>
- Use pruning techniques to reduce M

#### Reduce the number of transactions (N)

- Reduce size of N as the size of itemset increases
- Used by DHP (Direct Hashing and Pruning) and vertical-based mining algorithms

### Reduce the number of comparisons (NM)

- Use efficient data structures to store the candidates or transactions
- No need to match every candidate against every transaction

#### Reducing Number of Candidates

### **Apriori principle:**

If an itemset is frequent, then all of its subsets must also be frequent

Apriori principle holds due to the following property of the support measure:

$$\forall X, Y : (X \subseteq Y) \Rightarrow s(X) \ge s(Y)$$
Where  $s(X)$  support of  $X$ 

- Support of an itemset never exceeds the support of its subsets
- This is known as the anti-monotone property of support

# Illustrating Apriori Principle Items (1-itemsets)

| Item   | Count |
|--------|-------|
| Bread  | 4     |
| Coke   | 2     |
| Milk   | 4     |
| Beer   | 3     |
| Diaper | 4     |
| Eggs   | 1     |

| Itemset        | Count |
|----------------|-------|
| {Bread,Milk}   | 3     |
| {Bread,Beer}   | 2     |
| {Bread,Diaper} | 3     |
| {Milk,Beer}    | 2     |
| {Milk,Diaper}  | 3     |
| {Beer,Diaper}  | 3     |

| TID | Items                     |
|-----|---------------------------|
| 1   | Bread, Milk               |
| 2   | Bread, Diaper, Beer, Eggs |
| 3   | Milk, Diaper, Beer, Coke  |
| 4   | Bread, Milk, Diaper, Beer |
| 5   | Bread, Milk, Diaper, Coke |

Pairs (2-itemsets) (No need to generate candidates involving Coke or Eggs)

Triplets (3-itemsets)

| Minimum S | Support = 3 |
|-----------|-------------|
|-----------|-------------|

| If every subset is considered,                 |  |  |
|--|--|--|
| ${}^{6}C_{1} + {}^{6}C_{2} + {}^{6}C_{3} = 41$ |  |  |
| With support-based pruning,                    |  |  |
| 6 + 6 + 1 = 13                                 |  |  |

| Itemset             | Count |
|---------------------|-------|
| {Bread,Milk,Diaper} | 2     |

#### Apriori Algorithm

#### **Method:**

- Let k=1
- Generate frequent itemsets of length k
- Repeat until no new frequent itemsets are identified
  - Generate length (k+1) candidate itemsets from length k frequent itemsets
  - Prune candidate itemsets containing subsets of length k+1 that are infrequent
  - Count the support of each candidate by scanning the DB
  - Eliminate candidates that are infrequent, leaving only those that are frequent

### Reducing Number of Comparisons

#### **Candidate counting:**

- Scan the database of transactions to determine the support of each candidate itemset
- To reduce the number of comparisons, store the candidates in a hash structure

Instead of matching each transaction against every candidate, match it against candidates contained in the hashed buckets

#### 

#### Generate Hash Tree

Suppose you have 15 candidate itemsets of length 3:

*{*1 4 5*}*, *{*1 2 4*}*, *{*4 5 7*}*, *{*1 2 5*}*, *{*4 5 8*}*, *{*1 5 9*}*, *{*1 3 6*}*, *{*2 3 4*}*, *{*5 6 7*}*, *{*3 4 5*}*, *{*3 5 6*}*, *{*3 5 7*}*, *{*6 8 9*}*, {3 6 7}, {3 6 8}

We need a hash function H:

H(1) = left; H(4) = left; H(7) = left; H(2) = middle; H(5) = middle; H(8) = middle;H(3) = right; H(6) = right; H(9) = right

Max leaf size: max number of itemsets stored in a leaf node (if number of candidate itemsets)

exceeds max leaf size, split the node)

#### **Generate Hash Tree**

Suppose you have 15 candidate itemsets of length 3:

{1 4 5}, {1 2 4}, {4 5 7}, {1 2 5}, {4 5 8}, {1 5 9}, {1 3 6}, {2 3 4}, {5 6 7}, {3 4 5}, {3 5 6}, {3 5 7}, {6 8 9}, {3 6 7}, {3 6 8}

#### Generate Hash Tree

Suppose you have 15 candidate itemsets of length 3:

{1 4 5}, {1 2 4}, {4 5 7}, {1 2 5}, {4 5 8}, {1 5 9}, {1 3 6}, {2 3 4}, {5 6 7}, {3 4 5}, {3 5 6}, {3 5 7}, {6 8 9}, {3 6 7}, {3 6 8}

### Association Rule Discovery: Hash tree

# Association Rule Discovery: Hash tree

# Association Rule Discovery: Hash tree

#### Rule Generation

# Given a frequent itemset L, find all non-empty subsets $F \subset L$ such that $F \rightarrow L - F$ satisfies the minimum confidence requirement

• If {A,B,C,D} is a frequent itemset, candidate rules:

$$A \rightarrow BCD, B \rightarrow ACD, C \rightarrow ABD, D \rightarrow ABC$$

$$C \rightarrow ABD$$
,

$$AB \rightarrow CD$$
,  $AC \rightarrow BD$ ,  $AD \rightarrow BC$ ,  $BC \rightarrow AD$ ,

$$AD \rightarrow BC$$

$$BC \rightarrow AD$$
.

$$BD \rightarrow AC$$
,  $CD \rightarrow AB$ ,

$$ABC \rightarrow D$$
,  $ABD \rightarrow C$ ,  $ACD \rightarrow B$ ,  $BCD \rightarrow A$ ,

$$ACD \rightarrow B$$
,

$$BCD \rightarrow A$$

If |L| = k, then there are  $2^k - 2$  candidate association rules (ignoring  $L \rightarrow \emptyset$ and  $\emptyset \rightarrow L$ )

$$Support_D(X) = \frac{|\{x \mid X \subseteq x, x \in D\}|}{|D|} = p(X) \le 1$$
 Support of X in D is the

proportion of records in D that have itemset X

Confidence<sub>D</sub>
$$(X \to Y) = p(Y \mid X) = \frac{Support_D(X \cup Y)}{Support_D(X)} \le 1$$

#### How to efficiently generate rules from frequent itemsets?

- In general, confidence does not have an anti-monotone property
   c(ABC →D) can be larger or smaller than c(AB →D)
- But confidence of rules generated from the same itemset has an antimonotone property
- e.g., L = {A,B,C,D}:

$$c(ABC \rightarrow D) \ge c(AB \rightarrow CD) \ge c(A \rightarrow BCD)$$

Confidence is anti-monotone w.r.t. number of items on the RHS of the rule

#### **COMP90049 Knowledge Technologies**

Confidence is anti-monotone w.r.t. number of items on the RHS of the rule

$$C(ABC \rightarrow D) = p(D|ABC) = p(ABCD)/P(ABC)$$

$$C(AB \rightarrow CD) = p(CD|AB) = p(ABCD)/P(AB)$$

$$C(ABC \rightarrow D)/C(AB \rightarrow CD) = p(AB)/P(ABC) \ge 1$$

$$C(ABC \rightarrow D) \ge C(AB \rightarrow CD)$$

# Rule Generation for Apriori Algorithm

Candidate rule is generated by merging two rules that share the same

prefix

in the rule consequent

join(CD=>AB,BD=>AC)
would produce the candidate
rule D => ABC

Prune rule D=>ABC if its subset AD=>BC does not have high confidence

# **Effect of Support Distribution**

### Many real data sets have skewed support distribution

Support distribution of a retail data set

### **Effect of Support Distribution**

#### How to set the appropriate *minsup* threshold?

- If minsup is set too high, we could miss itemsets involving interesting rare items (e.g., expensive products)
- If minsup is set too low, it is computationally expensive and the number of itemsets is very large

Using a single minimum support threshold may not be effective

### **Factors Affecting Complexity**

#### Choice of minimum support threshold

- lowering support threshold results in more frequent itemsets
- this may increase number of candidates and max length of frequent itemsets

#### Dimensionality (number of items) of the data set

- more space is needed to store support count of each item
- if number of frequent items also increases, both computation and I/O costs may also increase

#### Size of database

 since Apriori makes multiple passes, run time of algorithm may increase with number of transactions

#### Average transaction width

- transaction width increases with denser data sets
- This may increase max length of frequent itemsets and traversals of hash tree (number of subsets in a transaction increases with its width)

# Application of Interestingness Measure

#### Pattern Evaluation

### Association rule algorithms tend to produce too many rules

- many of them are uninteresting or redundant
- Redundant if {A,B,C} → {D} and {A,B} → {D} have same support & confidence

Interestingness measures can be used to prune/rank the derived patterns

In the original formulation of association rules, support & confidence are the only measures used

# Computing Interestingness Measure

# Given a rule $X \rightarrow Y$ , information needed to compute rule interestingness can be obtained from a contingency table

Contingency table for  $X \rightarrow Y$ 

|   | Y                      | Y               |                 |
|---|------------------------|-----------------|-----------------|
| X | f <sub>11</sub>        | f <sub>10</sub> | f <sub>1+</sub> |
| X | <b>f</b> <sub>01</sub> | f <sub>00</sub> | f <sub>o+</sub> |
|   | f <sub>+1</sub>        | f <sub>+0</sub> | ĮΤΙ             |

 $f_{11}$ : support of X and Y  $f_{10}$ : support of X and  $\overline{Y}$ 

f<sub>01</sub>: support of X and Y

f<sub>00</sub>: support of X and Y

### Used to define various measures

support, confidence, lift, Gini,
 J-measure, etc.

#### **Drawback of Confidence**

$$Support_D(X) = \frac{|\{x \mid X \subseteq x, x \in D\}|}{|D|} = p(X) \le 1$$
 Support of X in D is the proportion of records in D that have itemset X

Confidence<sub>D</sub> $(X \to Y) = p(Y \mid X) = \frac{Support_D(X \cup Y)}{Support_D(X)} \le 1$ 

|     | Coffee | Coffee |     |
|-----|--------|--------|-----|
| Tea | 15     | 5      | 20  |
| Tea | 75     | 5      | 80  |
|     | 90     | 10     | 100 |

#### Association Rule: Tea → Coffee

Confidence = P(Coffee|Tea) = 0.75

but P(Coffee) = 0.9

- ⇒ Although confidence is high, rule is misleading
- $\Rightarrow$  P(Coffee|Tea) = 0.9375

#### Statistical Independence

#### Population of 1000 students

- 600 students know how to swim (S)
- 700 students know how to bike (B)
- 420 students know how to swim and bike (S,B)
- $P(S \land B) = 420/1000 = 0.42$
- $P(S) \times P(B) = 0.6 \times 0.7 = 0.42$
- $P(S_AB) = P(S) \times P(B) => Statistical independence$
- P(S∧B) > P(S) × P(B) => Positively correlated
- P(S∧B) < P(S) × P(B) => Negatively correlated

#### Statistical-based Measures

# Measures that take into account statistical dependence

Lift also called Interest = 
$$\frac{P(Y|X)}{P(Y)} = \frac{P(X,Y)}{P(X)P(Y)}$$

$$PS = P(X,Y) - P(X)P(Y)$$

$$\phi - coefficient = \frac{P(X,Y) - P(X)P(Y)}{\sqrt{P(X)[1 - P(X)]P(Y)[1 - P(Y)]}}$$

The rest of the slides from this topic is not examinable. However, if you prepared to study them the rest of the slides can be very useful in your future research projects.

#### Compact Representation of Frequent Itemsets

# Some itemsets are redundant because they have identical support as their supersets

| TID | <b>A1</b> | A2 | <b>A3</b> | <b>A4</b> | <b>A5</b> | <b>A6</b> | <b>A7</b> | <b>A8</b> | <b>A9</b> | A10 | B1 | B2 | В3 | B4 | <b>B</b> 5 | <b>B6</b> | B7 | B8 | B9 | B10 | <b>C1</b> | C2 | C3 | <b>C4</b> | C5 | C6 | <b>C7</b> | C8 | C9 | C10 |
|-----|-----------|----|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----|----|----|----|----|------------|-----------|----|----|----|-----|-----------|----|----|-----------|----|----|-----------|----|----|-----|

# FP-growth Algorithm

Use a compressed representation of the database using an FP-tree

Once an FP-tree has been constructed, it uses a recursive divide-and-conquer approach to mine the frequent itemsets

## FP-tree construction

| TID | Items         |
|-----|---------------|
| 1   | {A,B}         |
| 2   | $\{B,C,D\}$   |
| 3   | $\{A,C,D,E\}$ |
| 4   | $\{A,D,E\}$   |
| 5   | $\{A,B,C\}$   |
| 6   | $\{A,B,C,D\}$ |
| 7   | {B,C}         |
| 8   | $\{A,B,C\}$   |
| 9   | $\{A,B,D\}$   |
| 10  | $\{B,C,E\}$   |

**After reading TID=1:** 

**After reading TID=2:** 

| TID | Items         |
|-----|---------------|
| 1   | {A,B}         |
| 2   | {B,C,D}       |
| 3   | $\{A,C,D,E\}$ |
| 4   | $\{A,D,E\}$   |
| 5   | $\{A,B,C\}$   |
| 6   | $\{A,B,C,D\}$ |
| 7   | {B,C}         |
| 8   | $\{A,B,C\}$   |
| 9   | $\{A,B,D\}$   |
| 10  | {B,C,E}       |

#### **Header table**

| Item | Pointer |
|------|---------|
| Α    |         |
| В    |         |
| С    |         |
| D    |         |
| Е    |         |

frequent itemset generation

# FP-growth

Conditional Pattern base for D:

```
P = {(A:1,B:1,C:1),
(A:1,B:1),
(A:1,C:1),
(A:1),
(B:1,C:1)}
```

Recursively apply FP -growth on P

Frequent Itemsets found (with sup > 1):
AD(4), BD(3), CD(3),
ACD(2), BCD(2), ABD(2)

#### Tree Projection

# Items are listed in lexicographic order Each node P stores the following information:

- Itemset for node P
- List of possible lexicographic extensions of P: E(P)
- Pointer to projected database of its ancestor node
- Bitvector containing information about which transactions in the projected database contain the itemset

# **Projected Database**

#### **Original Database:**

| TID | Items         |
|-----|---------------|
| 1   | {A,B}         |
| 2   | {B,C,D}       |
| 3   | $\{A,C,D,E\}$ |
| 4   | $\{A,D,E\}$   |
| 5   | $\{A,B,C\}$   |
| 6   | $\{A,B,C,D\}$ |
| 7   | {B,C}         |
| 8   | $\{A,B,C\}$   |
| 9   | $\{A,B,D\}$   |
| 10  | {B,C,E}       |

# Projected Database for node A:

| TID | Items   |
|-----|---------|
| 1   | {B}     |
| 2   | {}      |
| 3   | {C,D,E} |
| 4   | {D,E}   |
| 5   | {B,C}   |
| 6   | {B,C,D} |
| 7   | {}      |
| 8   | {B,C}   |
| 9   | {B,D}   |
| 10  | {}      |

For each transaction T, projected transaction at node A is T - A If  $A \in T$  {} Otherwise

#### **ECLAT**

# For each item, store a list of transaction ids (tids)

Horizontal Data Layout

| TID | Items   |
|-----|---------|
| 1   | A,B,E   |
| 2   | B,C,D   |
| 3   | C,E     |
| 4   | A,C,D   |
| 5   | A,B,C,D |
| 6   | A,E     |
| 7   | A,B     |
| 8   | A,B,C   |
| 9   | A,C,D   |
| 10  | В       |

**Vertical Data Layout** 

| Α           | В      | O           | D                | Ш      |
|-------------|--------|-------------|------------------|--------|
| 1           | 1      | 2           | 2                | 1      |
| 4           | 2      | 2<br>3<br>4 | 4                | 3<br>6 |
| 4<br>5<br>6 | 2<br>5 |             | 2<br>4<br>5<br>9 | 6      |
| 6           | 7      | 8<br>9      | 9                |        |
| 7           | 8      | 9           |                  |        |
| 8<br>9      | 10     |             |                  |        |
| 9           |        |             |                  |        |

↓ TID-list

#### **ECLAT**

Determine support of any k-itemset by intersecting tid-lists of two of its (k-1) subsets.

| Α |          |     |            |
|---|----------|-----|------------|
| 1 | •        | В   | AB         |
|   | <b>\</b> | 1   | 1          |
| 4 |          | 2   | - <u>-</u> |
| 5 |          | 5   | 5          |
| 6 |          | 7   | 7          |
| 7 |          | - / | 8          |
| 8 |          | 8   |            |
|   |          | 10  |            |
| 9 |          |     |            |

# 3 traversal approaches:

top-down, bottom-up and hybrid

Advantage: very fast support counting

Disadvantage: intermediate tid-lists may become too large for memory

# Multiple Minimum Support

#### How to apply multiple minimum supports?

- MS(i): minimum support for item i
- e.g.: MS(Milk)=5%, MS(Coke) = 3%, MS(Broccoli)=0.1%, MS(Salmon)=0.5%
- MS({Milk, Broccoli}) = min (MS(Milk), MS(Broccoli))= 0.1%
- Challenge: Support is no longer anti-monotone

Suppose: Support(Milk, Coke) = 1.5% and

Support(Milk, Coke, Broccoli) = 0.5%

{Milk,Coke} is infrequent but {Milk,Coke,Broccoli} is frequent due to different minimum support requirements!

# Multiple Minimum Support

| Item | MS(I) | Sup(I) |
|------|-------|--------|
|      |       |        |
|      |       |        |
| Α    | 0.10% | 0.25%  |
|      |       |        |
|      |       |        |
| В    | 0.20% | 0.26%  |
|      |       |        |
|      |       |        |
| С    | 0.30% | 0.29%  |
|      |       |        |
|      |       |        |
| D    | 0.50% | 0.05%  |
|      |       |        |
|      |       |        |
| E    | 3%    | 4.20%  |

### Multiple Minimum Support

| Item | MS(I) | Sup(I) |
|------|-------|--------|
|      |       | 1 ( )  |
|      |       |        |
| Α    | 0.10% | 0.25%  |
|      |       |        |
|      |       |        |
| В    | 0.20% | 0.26%  |
|      |       |        |
|      |       |        |
| С    | 0.30% | 0.29%  |
|      |       |        |
|      |       |        |
| D    | 0.50% | 0.05%  |
|      |       |        |
|      |       |        |
| E    | 3%    | 4.20%  |

# Multiple Minimum Support (Liu 1999)

#### Order the items according to their minimum support (in ascending order)

- e.g.: MS(Milk)=5%, MS(Coke) = 3%, MS(Broccoli)=0.1%, MS(Salmon)=0.5%
- Ordering: Broccoli, Salmon, Coke, Milk

#### **Need to modify Apriori such that:**

- L<sub>1</sub>: set of frequent items
- F<sub>1</sub>: set of items whose support is ≥ MS(1) where MS(1) is min<sub>i</sub>( MS(i) )
- C<sub>2</sub>: candidate itemsets of size 2 is generated from F<sub>1</sub> instead of L<sub>1</sub>

# Multiple Minimum Support (Liu 1999)

#### **Modifications to Apriori:**

In traditional Apriori,

A candidate (k+1)-itemset is generated by merging two frequent itemsets of size k

The candidate is pruned if it contains any infrequent subsets of size k

Pruning step has to be modified:

Prune only if subset contains the first item

e.g.: Candidate={Broccoli, Coke, Milk} (ordered according to minimum support)

{Broccoli, Coke} and {Broccoli, Milk} are frequent but {Coke, Milk} is infrequent

Candidate is not pruned because {Coke,Milk} does not contain the first item, i.e., Broccoli.

## Example: Lift/Interest

|     | Coffee | Coffee |     |
|-----|--------|--------|-----|
| Tea | 15     | 5      | 20  |
| Tea | 75     | 5      | 80  |
|     | 90     | 10     | 100 |

Association Rule: Tea → Coffee

Confidence = P(Coffee|Tea) = 0.75

but P(Coffee) = 0.9

 $\Rightarrow$  Lift = 0.75/0.9= 0.8333 (< 1, therefore is negatively associated)

# Drawback of Lift & Interest

|   | Υ  | Y  |     |
|---|----|----|-----|
| X | 10 | 0  | 10  |
| X | 0  | 90 | 90  |
|   | 10 | 90 | 100 |

|   | Υ  | Ŧ  |     |
|---|----|----|-----|
| X | 90 | 0  | 90  |
| X | 0  | 10 | 10  |
|   | 90 | 10 | 100 |

$$Lift = \frac{1.0}{0.1} = 10$$

*Lift* also called *Interest* = 
$$\frac{P(Y \mid X)}{P(Y)} = \frac{P(X,Y)}{P(X)P(Y)}$$

$$PS = P(X, Y) - P(X)P(Y)$$

$$\phi - coefficient = \frac{P(X,Y) - P(X)P(Y)}{\sqrt{P(X)[1 - P(X)]P(Y)[1 - P(Y)]}}$$
 Statistical independence: 
$$\mathbf{f}(X,Y) = \mathbf{f}(X,Y) =$$

$$Lift = \frac{1.0}{0.9} = 1.11$$

#### Statistical independence:

If 
$$P(X,Y)=P(X)P(Y) \Rightarrow Lift = 1$$

# There are lots of measures proposed in the literature

Some measures are good for certain applications, but not for others

What criteria should we use to determine whether a measure is good or bad?

What about Apriori -style support based pruning? How does it affect these measures?

#### Properties of A Good Measure

#### Piatetsky-Shapiro:

#### 3 properties a good measure M must satisfy:

- M(A,B) = 0 if A and B are statistically independent
- M(A,B) increase monotonically with P(A,B) when P(A) and P(B) remain unchanged
- M(A,B) decreases monotonically with P(A) [or P(B)] when P(A,B) and P(B) [or P(A)] remain unchanged

# **Comparing Different Measures**

10 examples of contingency tables:

Rankings of contingency tables using various measures:

| Example | f <sub>11</sub> | <b>f</b> <sub>10</sub> | f <sub>01</sub> | f <sub>00</sub> |
|---------|-----------------|------------------------|-----------------|-----------------|
| E1      | 8123            | 83                     | 424             | 1370            |
| E2      | 8330            | 2                      | 622             | 1046            |
| E3      | 9481            | 94                     | 127             | 298             |
| E4      | 3954            | 3080                   | 5               | 2961            |
| E5      | 2886            | 1363                   | 1320            | 4431            |

# Property under Variable Permutation

|                  | В | $\overline{\mathbf{B}}$ |                         | A | $\overline{\mathbf{A}}$ |
|------------------|---|-------------------------|-------------------------|---|-------------------------|
| A                | p | q                       | В                       | р | r                       |
| $\overline{f A}$ | r | S                       | $\overline{\mathbf{B}}$ | q | S                       |

Does M(A,B) = M(B,A)?

# Symmetric measures:

support, lift, collective strength, cosine, Jaccard, etc

# Asymmetric measures:

confidence, conviction, Laplace, J-measure, etc

#### Property under Row/Column Scaling

# Grade-Gender Example (Mosteller, 1968):

|      | Male | Female |    |
|------|------|--------|----|
| High | 2    | 3      | 5  |
| Low  | 1    | 4      | 5  |
|      | 3    | 7      | 10 |

|      | Male | Female |    |
|------|------|--------|----|
| High | 4    | 30     | 34 |
| Low  | 2    | 40     | 42 |
|      | 6    | 70     | 76 |

10x

Mosteller:

Underlying association should be independent of the relative number of male and female students in the samples

# Property under Inversion Operation

Example: φ-Coefficient

$$\phi - coefficient = \frac{P(X,Y) - P(X)P(Y)}{\sqrt{P(X)[1 - P(X)]P(Y)[1 - P(Y)]}}$$

φ-coefficient is analogous to correlation coefficient for continuous variables

|   | Y  | Y  |     |
|---|----|----|-----|
| X | 60 | 10 | 70  |
| X | 10 | 20 | 30  |
|   | 70 | 30 | 100 |

|   | Υ  | Y  |     |
|---|----|----|-----|
| X | 20 | 10 | 30  |
| * | 10 | 60 | 70  |
|   | 30 | 70 | 100 |

$$\phi = \frac{0.6 - 0.7 \times 0.7}{\sqrt{0.7 \times 0.3 \times 0.7 \times 0.3}}$$
$$= 0.5238$$

$$= \frac{0.6 - 0.7 \times 0.7}{\sqrt{0.7 \times 0.3 \times 0.7 \times 0.3}} \qquad \phi = \frac{0.2 - 0.3 \times 0.3}{\sqrt{0.7 \times 0.3 \times 0.7 \times 0.3}}$$
$$= 0.5238 \qquad = 0.5238$$

φ Coefficient is the same for both tables

### Property under Null Addition

|                         | В | $\overline{\mathbf{B}}$ |       |                         | В | $\overline{\mathbf{B}}$ |
|-------------------------|---|-------------------------|-------|-------------------------|---|-------------------------|
| A                       | p | q                       |       | A                       | p | q                       |
| $\overline{\mathbf{A}}$ | r | S                       | \<br> | $\overline{\mathbf{A}}$ | r | s + k                   |

#### Invariant measures:

support, cosine, Jaccard, etc

### Non-invariant measures:

correlation, Gini, mutual information, odds ratio, etc

### **COMP90049 Knowledge Technologies**

## Different Measures have Different Properties

| Symbol | Measure             | Range  | P1   | P2  | P3  | 01    | O2  | O3   | O3' | 04  |
|--------|---------------------|--|------|-----|-----|-------|-----|------|-----|-----|
| Ф      | Correlation         | -1 0 1   | Yes  | Yes | Yes | Yes   | No  | Yes  | Yes | No  |
| λ      | Lambda              | 0 1  | Yes  | No  | No  | Yes   | No  | No*  | Yes | No  |
| α      | Odds ratio          | 0 1 ∞  | Yes* | Yes | Yes | Yes   | Yes | Yes* | Yes | No  |
| Q      | Yule's Q            | -1 0 1   | Yes  | Yes | Yes | Yes   | Yes | Yes  | Yes | No  |
| Y      | Yule's Y            | -1 0 1   | Yes  | Yes | Yes | Yes   | Yes | Yes  | Yes | No  |
| К      | Cohen's             | -1 0 1   | Yes  | Yes | Yes | Yes   | No  | No   | Yes | No  |

| K      | Klosgen's           | $\left(\sqrt{\frac{2}{\sqrt{3}}-1}\right)\left(2-\sqrt{3}-\frac{1}{\sqrt{3}}\right)\dots 0\dots \frac{2}{3\sqrt{3}}$ | Yes  | Yes | Yes | No    | No  | No   | No  | No  |

## **Support-based Pruning**

Most of the association rule mining algorithms use support measure to prune rules and itemsets

#### Study effect of support pruning on correlation of itemsets

- Generate 10000 random contingency tables
- Compute support and pairwise correlation for each table
- Apply support-based pruning and examine the tables that are removed

### Effect of Support-based Pruning

### **All Itempairs**

Correlation

## Effect of Support-based Pruning

### Investigate how support-based pruning affects other measures

### Steps:

- Generate 10000 contingency tables
- Rank each table according to the different measures
- Compute the pair-wise correlation between the measures

# Effect of Support-based Pruning

## Without Support Pruning (All Pairs)

- Red cells indicate correlation between the pair of measures > 0.85
- 40.14% pairs have correlation > 0.85

Scatter Plot between Correlation & Jaccard Measure

# • $0.5\% \le \text{support} \le 50\%$

Scatter Plot between Correlation & Jaccard Measure:

# • $0.5\% \le \text{support} \le 30\%$

◆ 76.42% pairs have correlation > 0.85

Scatter Plot between Correlation & Jaccard Measure

## Subjective Interestingness Measure

#### **Objective measure:**

- Rank patterns based on statistics computed from data
- e.g., 21 measures of association (support, confidence, Laplace, Gini, mutual information, Jaccard, etc).

#### **Subjective measure:**

Rank patterns according to user's interpretation

A pattern is subjectively interesting if it contradicts the expectation of a user (Silberschatz & Tuzhilin)

A pattern is subjectively interesting if it is actionable (Silberschatz & Tuzhilin)

#### Need to model expectation of users (domain knowledge)

- + Pattern expected to be frequent
- Pattern expected to be infrequent
- Pattern found to be frequent
- Pattern found to be infrequent
- + Expected Patterns
- Unexpected Patterns

Need to combine expectation of users with evidence from data (i.e., extracted patterns)

### Web Data (Cooley et al 2001)

- Domain knowledge in the form of site structure
- Given an itemset F = {X<sub>1</sub>, X<sub>2</sub>, ..., X<sub>k</sub>} (X<sub>i</sub>: Web pages)

L: number of links connecting the pages

$$Ifactor = L / (k \times k-1)$$

cfactor = 1 (if graph is connected), 0 (disconnected graph)

Structure evidence = cfactor × lfactor

• Usage evidence 
$$= \frac{P(X_1 \cap X_2 \cap ... \cap X_k)}{P(X_1 \cup X_2 \cup ... \cup X_k)}$$

Use Dempster-Shafer theory to combine domain knowledge and evidence from data
